INTERNSHIP DOMAIN: AI AUTOMATION

Day 13 — Generative AI & LLM Fundamentals

Google Gemini API Test

Objective

Set up and verify Google Gemini model access through Postman.

API Setup

Provider: Google Gemini

API key: Generated successfully.

Authentication: Google API key (x-goog-api-key)

Test endpoint: <https://generativelanguage.googleapis.com/v1beta/models/gemini-3.6-flash:generateContent>

Sample API Test

Test prompt: “Explain how AI works in a few words.”

Result: 200 OK — successful test call.

Provider Comparison Note

For classification, I would use Google Gemini when I need reliable text understanding and clear category-based output. It can classify inputs such as leads into High, Medium, or Low priority when given clear instructions. Gemini is also useful for long-context work because a suitable Gemini model can process a large amount of information together. I would choose Gemini for long documents when its available context and model quality match the project needs.
